

Project Executable Files

Date	5 July 2026
Team ID	xxxxxx
Project Name	Credit Card Approval Prediction System
Maximum Marks	3 Marks

Project Executable Files

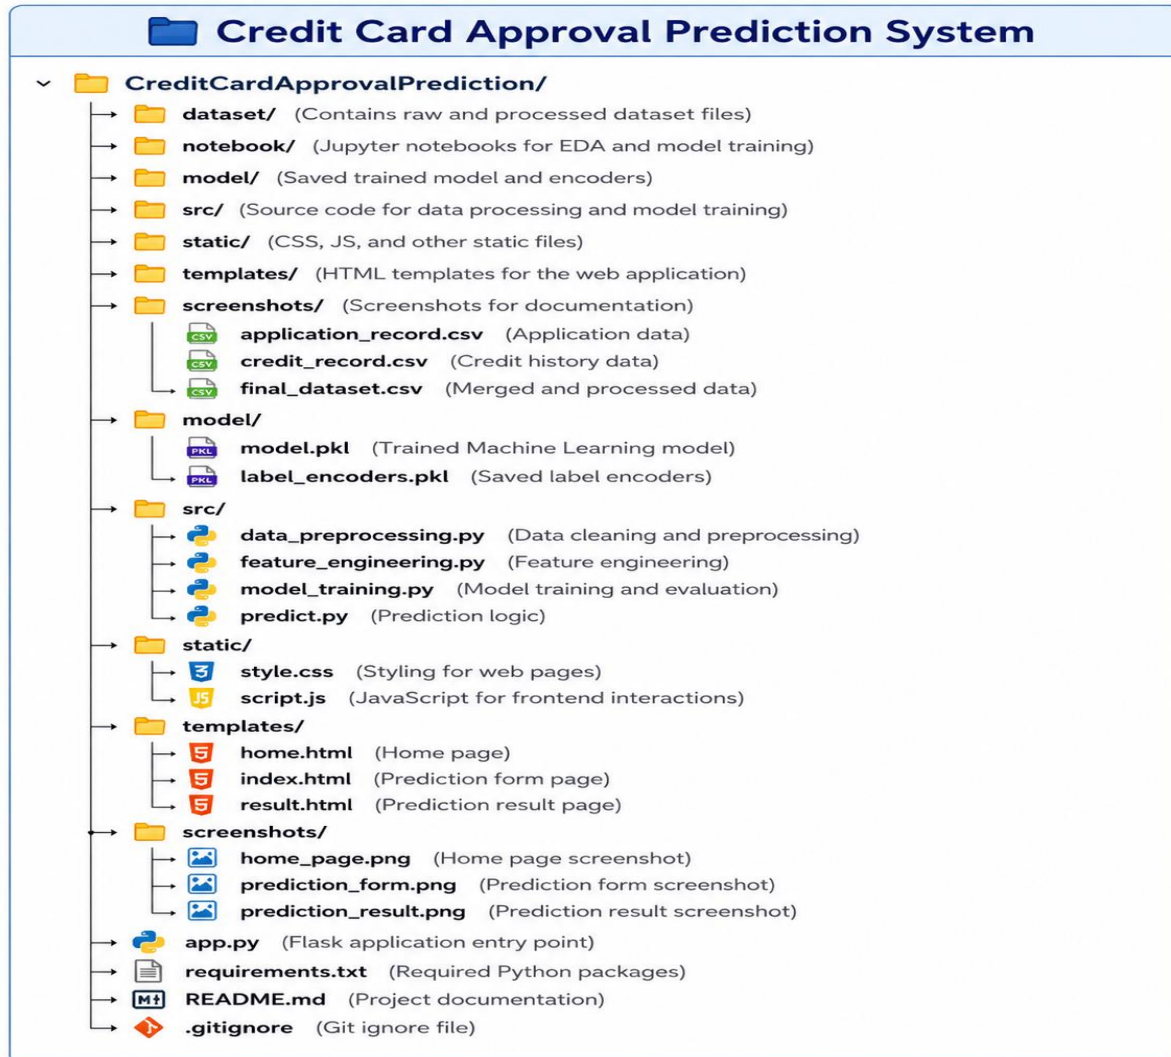

This section includes all the executable and deployment files required to run the Credit Card Approval Prediction System. The project source code, trained Machine Learning model, documentation, dependencies, deployment link, and supporting files are organized to enable easy execution.

Step 1: Submission Checklist

S.No	Item to Submit	Submitted (Yes / No / NA)
1	Complete source code (all files and folders)	Yes
2	README / Setup Guide (instructions to run the project)	Yes
3	requirements.txt / package.json / dependency file	Yes
4	Database schema / seed files (if applicable)	NA
5	Environment or configuration file (.env.example similar)	NA
6	Deployed application URL (if hosted)	Yes
7	APK / Executable binary (if applicable for mobile/desktop apps)	NA
8	Dockerfile / Containerization config (if applicable)	NA
9	Test files and test results	Yes
10	Demo video or walkthrough (if required)	Yes

Step 2: File / Folder Structure

Provide an overview of your project's file and folder structure below:

Step 3: Deployment / Access Details

Field	Details
Hosted / Deployed URL	https://creditcardapprovalprediction-cs jq.onrender.com
Login Credentials (Demo)	Not Required
Platform / Hosting Provider	Render

Repository Link	https://github.com/Keerthireddy0103/CreditCardApprovalPrediction
Demo Video Link	https://drive.google.com/file/d/1cRpB8OWsOxHzVwIaPbzJcmj7uBitTFBg/view?usp=drivesdk

Step 4: Run Instructions

Provide clear, step-by-step instructions for the evaluator to run your project locally:

Run Instructions – Credit Card Approval Prediction System

- 1

Download or clone the Credit Card Approval Prediction project from the GitHub repository.

git clone https://github.com/Keerthireddy0103/CreditCardApprovalPrediction.git
- 2

Open the project folder in Visual Studio Code or any Python IDE.

cd CreditCardApprovalPrediction
- 3

Create a virtual environment:

python -m venv venv
- 4

Activate the virtual environment:

On Windows : venv\Scripts\activate
 On Mac / Linux : source venv/bin/activate
- 5

Install all required dependencies:

pip install -r requirements.txt
- 6

Ensure the dataset, trained model, and encoders are in their respective folders.
(Dataset in /dataset, model in /model.pkl, templates in /templates, static files in /static)
- 7

Run the Flask application:

python app.py
- 8

Open a web browser and navigate to:

http://127.0.0.1:5000/

(If deployed on Render, use your Render URL)
- 9

Enter the required applicant details in the form and click **Predict** to view the credit card approval prediction.
- 10

Exit the application:

Press Ctrl + C in the terminal to stop the Flask server.

Step 5: Known Issues / Limitations

S.No	Known Issue / Limitation	Workaround / Status
1	Prediction accuracy depends on the quality and size of the training dataset.	Improve the dataset and retrain the Machine Learning model.
2	The application does not support user authentication or applicant data storage.	Can be implemented in future versions using a database and login system.

3	On Render's free plan, the application may take a few seconds to start after being inactive.	Wait a few seconds and refresh the page if necessary.
